

Build on VM Notes

All changes to the code has to be done in `content_management` branch. Once changes are ready to be deployed, they have to be pushed to remote `content_management` branch.

After that you need to create a pull request to merge `content_management` branch into `integration` branch.

In order to build on VM you need to specify that you want to build `integration` branch.

Project Build

This build requires parameters:

GIT_BRANCH
