How to make Front End component Custom.

In order to make HTML component custom upfront work to convert it from static to dynamic (custom) is necessary.

Diagram below show the steps necessary.

```
   ┌─────────┐      Create Component in           Make Component
   │  Start  │──▶   Drupal                 ──▶    Customizable
   └─────────┘      Make it 'Not Approved'        on Front End Code Base
                    and 'Unpublished'                    │
                                                         ▼
                    Serve Component From         Rebuild Front End Code
                    Drupal to Front End    ◀──   to use Dynamic Version
                           │                     of Componennt
                           ▼
                    Use Deep Link from
                    Stage Front End       ──▶    Approve Component
                    to edit Component in                 │
                    Drupal                               ▼
   ┌─────────┐                                   Publish Approved
   │   End   │  ◀──────────────────────────────  Content
   └─────────┘
```
