Content Management - Font End Guide

Step 1: Get all content with a certain tag

Method

```
tagged_content(*tags)
```

Examples

```
tagged_content('footer')
```

or

```
tagged_content('footer','header',dashboard')
```

Description

Use the method in the routes. This allows for similar content to be grouped into one API call. It well then populate our chached hash that is referenced throughout the site.

Step 2: Get a managed pieces of content

Method

```
content(id, fallback = nil, product: nil)
```

Examples

```
<%== content('request_a_payment', '- request a payment.') %>
```

or

```
<%|= content('expense_info_notes') do %>
<p class='card-text step-2-text type-group type-payment type-reimbursement'></p>
<%| end %>
```

Description

For most cases, simply pass in the cm_id as the first argument and the fallback (if call fails or Drupal doesn't find a match) as the second argument. You can also pass a block of content as seen in the later example.
